

Sludge Storage Basins & Anaerobic Ponds

SolarBee® outperforms Brush Aerators

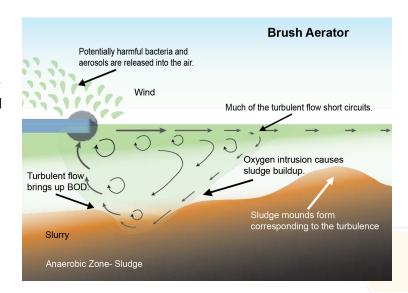

SolarBee®

- Maintains a high dissolved oxygen "odor cap" within the top 2 ft. of the pond 24 hrs. per day.
- Gentle, near-laminar radial flow from the center of the pond reaches to all ends of the pond.
 No turbulence means no BOD is brought up to destroy the odor cap.
- Uniform surface renewal improves anaerobic digestion to reduce sludge volume and increase sludge densification.
- No aerosols or bacteria are released into the air; there is no struvite buildup caused by aerosols.
- Coverage up to 5 acres per machine, stainless steel construction, minimal energy and maintenance costs, 25 year life, SCADA outputs.

Uniform surface renewal results in increased anaerobic digestion and reduction in sludge volume. Aerobic Zone - Odor Cap No aerosols or bacteria are released into the air. SolarBee® mixing results in increased sludge reduction, sludge densification, and an even sludge layer. Slurry Anaerobic Zone - Sludge

Brush Aerators

- Turbulent flow brings up BOD that can destroy the odor cap and cause odor events.
- The turbulent flow, all coming from one end of the pond, does not give uniform surface renewal at the other end. Turbulent flow is like trying to push a string.
- Sludge mounding is common. Sludge digestion is inhibited by oxygen intrusion and methane buildup due to lack of constant surface renewal.
- Aerosols and potentially-harmful bacteria are released into the air and can be carried by wind into the surrounding neighborhoods.
- Higher energy and maintenance costs.
